

1. (15 pts) **We're going to play Final (exam) Jeopardy!** Associate the following answers with the appropriate question. (You are given the "answers": Pick the "question" that goes best with each "answer".) The first two have been done for you.

"Answers:"

- 1 (t). A lame attempt at humor.
- 2 (u) Anywhere but here.
3. That portion of the system bus used for the transfer of an Address.
4. A technique in which the occurrence of one event on a bus follows and depends only on the occurrence of a previous event.
5. To maximize the efficient use of an expensive system.
6. To make Memory appear to cost as much as the cheapest element and perform as well as the fastest element.
7. Technique used in CD-ROM Drives.
8. A technique in which an I/O device is periodically checked to see if it needs service.
9. A binary digit appended to a group of binary digits to make the sum of all the digits either always odd or always even.
10. A structure that holds recent mappings of virtual to physical addresses.
11. A structure that holds the contents of recently referenced memory locations.
12. An unscheduled subroutine call.

"Questions:"

- a) What is synchronous timing?
- b) What is asynchronous timing?
- c) What is a Cache?
- d) What is an Address Translation Lookaside Buffer?
- e) What is the Address Bus?
- f) What is the Data Bus?
- g) What is a Parity error?
- h) What is a Register?
- i) What is DMA?
- j) What is an interrupt?
- k) What is a Page?
- l) What is a Floating Point number?
- m) What is a Page Fault?
- n) What is a Parity bit?
- o) What is a Sign bit?
- p) What is the goal of the Memory Hierarchy?
- q) What is polling?
- r) What is the goal of multiprogramming?
- s) What is Constant Linear Velocity?
- t) What is this question?
- u) Where would I rather be right now than where I am?

7. (6) Given a logical 20-bit address and a 128K-byte physical memory for a byte-addressable machine,

How big is the physical address space?

How big is the virtual address space?

Assuming 1K-byte pages, how many page frames are there? How many pages?

Assuming 8K-byte pages, how many page frames are there? How many pages?

8. (3 pts) For the following 8-bit patterns, add a 9th bit to create:

Even Parity: 00011011_

Odd Parity: 00101101_

What is the Hamming distance between these two codewords?

9. (8 pts) Here is a 12-bit Error Correction code format (same one used in class):

$d_8 d_7 d_6 d_5 C_4 d_4 d_3 d_2 C_3 d_1 C_2 C_1$

- a. Given the *data* bit pattern

1 1 0 1 0 0 1 0

in a machine using the above ECC code, what bit pattern gets sent to memory? (No credit will be given without work being shown.)

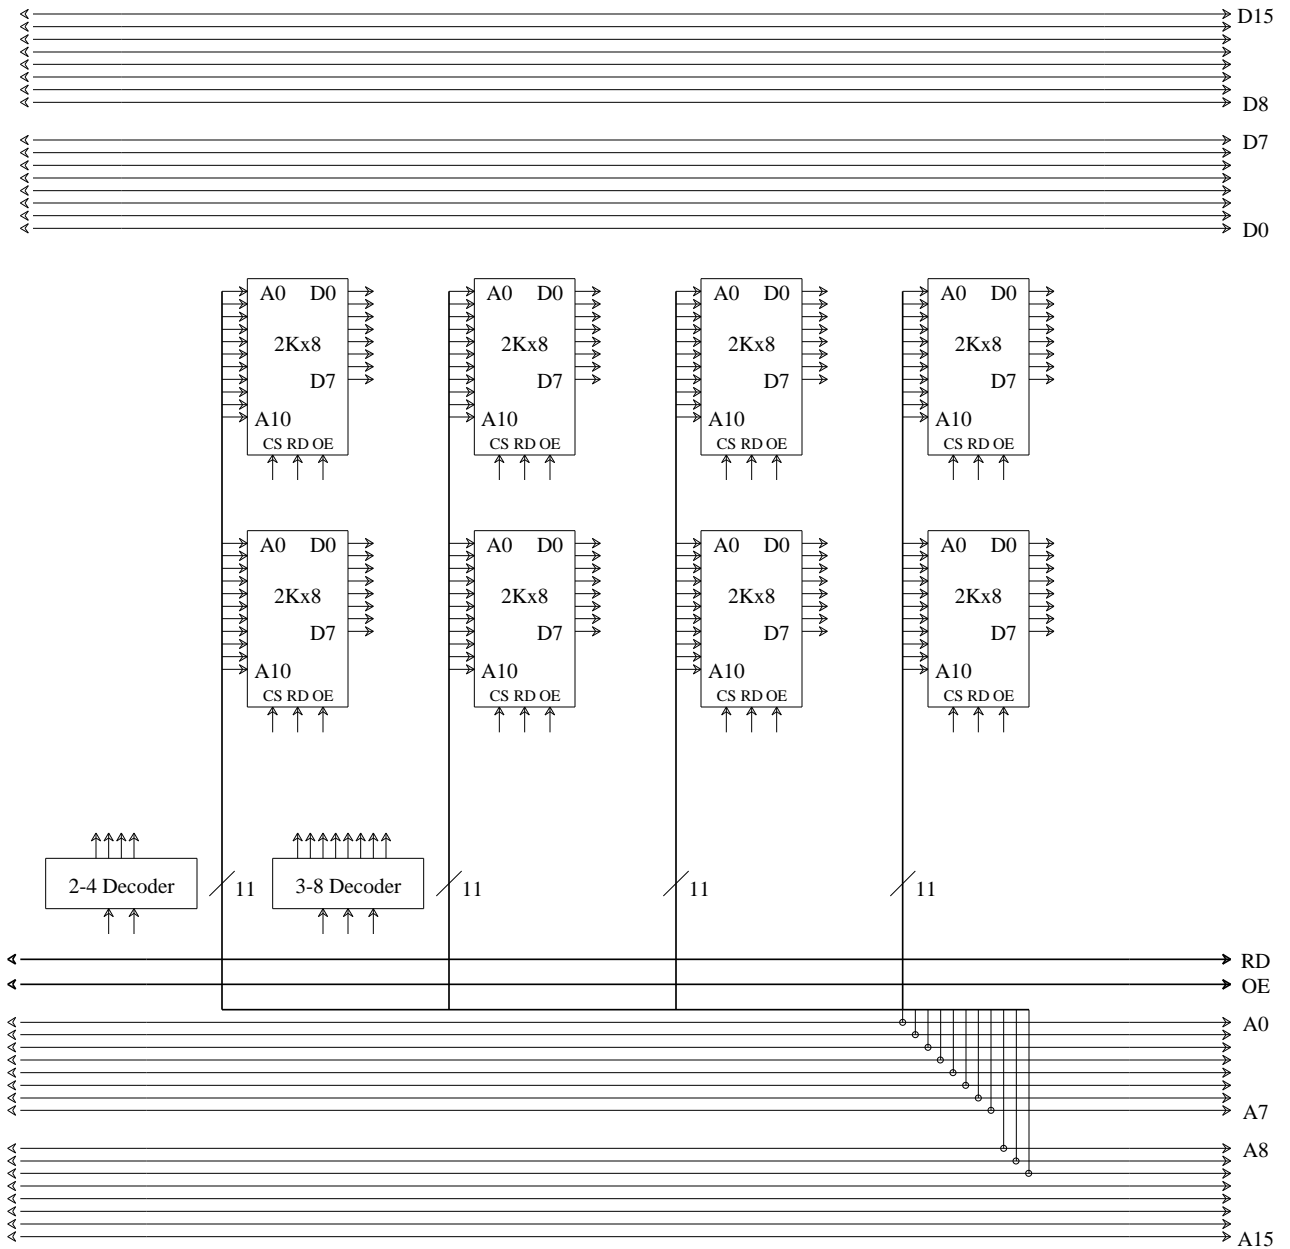

- b. In this same machine, the following bit pattern is retrieved from memory:

1 0 1 1 0 1 0 1 0 1 1 0

Assuming the above Error Correction code format, identify and correct any errors that may have occurred during transmission or storage. (No credit will be given without work being shown.)

10. (7 pts) Add the connections to the following diagram necessary to create a 16Kx8 memory. Not all of the hardware shown is required to perform this task.

CS - Chip Select
 OE - Output Enable
 RD - Read (Read/Write, technically)

11. (5 pts) Add arrows to the following diagram to indicate which signal transitions **cause** other transitions to occur.

Now explain in words (briefly) what the arrows you have added are doing. (What is the sequence of events in words?)

12. (25) Megatron Corporation makes the "Megamax Infinity", a byte-addressable computer with a 16-bit word size. In this machine the bus to main memory is 32 bits wide, and accessing Main memory takes 8 clock cycles. In order to improve performance, they are considering adding a 64-byte Direct-Mapped cache with a line size of 2 words and an access time of 1 cycle. Given the following address reference sequence (in Hex):

0xB4,0xB6,0xB8,0x38,0x13

a) Write down how you are partitioning each address (which bits are the Tag, offset, etc.)

b) In the table below, fill in the proposed Cache's Tag values after each memory reference has been processed. If it is a hit, mark the entry number to indicate this, and if it is a miss enter what the new tag should be.

Tag Array		Contents of Tag Array after processing address (Time ->)				
Entry Number	Initial Contents	0xB4 (10110100)	0xB6 (10110110)	0xB8 (10111000)	0x38 (00111000)	0x13 (00010011)
0	10					
1	01					
2	11					
3	10					
4	00					
5	01					
6	10					
7	01					
8	10					
9	01					
A	11					
B	10					
C	00					
D	01					
E	00					
F	01					

What is the Average Memory access time for this sequence of references?

Now fill in the contents of the Data array after processing the given address references.
Write down only the ones that change.

Data Array Entry Number	Data Array Contents after processing address		
	0xB4	0xB6	0xB8
0			
1			
2			
3			
4			
5			
6			
7			
8			
9			
A			
B			
C			
D			
E			
F			

Memory Contents at Hex Address XY																
Most Significant Digit (X)	Least Significant Digit (Y)															
	0	1	2	3	4	5	6	7	8	9	a	b	c	d	e	f
0	23	20	6d	61	74	74	27	73	20	67	76	69	65	77	20	73
1	68	65	6c	6c	20	73	63	72	69	70	74	0a	73	65	74	20

f	8a	65	30	2f	c9	3a	58	72	3e	a0	4f	38	96	47	21	80

13. (22) Megatron decided to experiment with using a 40-byte 5-way Set Associative Cache (instead of the Direct-mapped Cache). Remember, the Megamax Infinity is a byte-addressable machine with a 16-bit word size, a line size of 2 words, a 32-bit bus to main memory, and a Main Memory access time of 8 cycles. The Cache access time is still 1 cycle. Given the same address reference sequence (in Hex) as before:

0xB4,0xB6,0xB8,0x38,0x13

a) Write down how you are partitioning each address (which bits are the Tag, offset, etc.)

b) In the table below, fill in the proposed Cache's Tag values after each memory reference has been processed. If it is a hit, mark the entry number to indicate this, and if it is a miss enter what the new tag should be. Use an LRU replacement scheme.

Tag Array			Contents of Tag Array after processing address (Time ->)					
Set Number	Entry Number	Age	Initial Contents	0xB4 (10110100)	0xB6 (10110110)	0xB8 (10111000)	0x38 (00111000)	0x13 (00010011)
0	0	newest-1	0 0 0 1 0					
	1	oldest	0 0 1 1 1					
	2	newest-3	1 0 0 1 1					
	3	newest	1 0 1 1 1					
	4	newest-2	1 0 0 1 0					
1	0	oldest	0 0 0 1 0					
	1	newest-3	0 1 0 0 1					
	2	newest	0 1 0 1 1					
	3	newest-1	1 1 1 1 0					
	4	newest-2	1 0 1 1 1					

What is the Average Memory access time for this sequence of references?

14. (12 pts) The following tables contain some of the information about a segmented, paged virtual memory system and certain select memory locations. Total physical memory size is 4K bytes, and the page size is 512 bytes. All numbers in this table are in Hex unless otherwise noted.

Segment Table		
Entry Number	Presence Bit	Page Table
0	1	3
1	0	0
2	1	1
3	1	7
4	1	2
5	1	2
6	1	2
7	1	2

Page Table 0			
Entry Number	Present? (1=Yes)	Disk Addr	Frame Number
0	1	1234123	0x4
1	0	0893748	0x7
2	1	2489567	0x1
3	1	9623873	0x5
4	1	AE76BD3	0x2
5	0	328759A	0x3
6	1	56D87AC	0x0
7	1	10A876D	0x6

5	0	328759A	0x7
6	1	56D87AC	0x0
7	1	10A876D	0x6

Page Table 7			
Entry Number	Present? (1=Yes)	Disk Addr	Frame Number
0	1	1234123	0x5
1	0	0893748	0x6
2	1	2489567	0x1
3	1	9623873	0x2
4	1	AE76BD3	0x4
5	0	328759A	0x2
6	1	56D87AC	0x5
7	1	10A876D	0x6

For each of the following convert the virtual address into a physical address (if possible) and write down the value of the memory location corresponding to the address. If it is not possible to do so, explain why.

0x30A4 (0 1 1 0 0 0 0 1 0 1 0 0 1 0 0 in binary).

0x1EA4 (0 0 1 1 1 1 0 1 0 1 0 0 1 0 0 in binary).

0x76A4 (1 1 1 0 1 1 0 1 0 1 0 0 1 0 0 in binary).

15. (20) Given the following table, draw the Karnaugh maps for $Y1'$, $Y2'$, and $Y3'$ and Z in terms of X , $Y1$, $Y2$ and $Y3$, and then write **minimum** boolean equations for each.

Present State (Y1 Y2 Y3)	Next State		Output	
	X=0 (Y1' Y2' Y3')	X=1 (Y1' Y2' Y3')	X=0	X=1
000	101	111	0	0
001	101	111	1	0
010	101	101	0	1
011	111	110	1	1
100	100	110	0	0
110	000	010	0	1
111	111	110	1	1

16. (15 pts) Given the following Karnaugh maps, implement the sequential machine using an T FF for Y1, a SR FF for Y2, and a JK FF for Y3. You do not need to draw the gates, but you do need to write down the **minimized** input equations for each of the inputs of each of the Flip Flops in the circuit.
